Subject: Re: Request for final decision for manuscript number 2013 ACSj 3318

I read the manuscript.

The reviewer's comments are reasonable, and authors have revised according to the comments.

The revision was done satisfactorily, however, I cannot recommend the manuscript for publication in ACSJ at present.

Authors should revise again with regard to the following points.

1) Compound name

"2(1H)-quinoline" is incorrect.

"quinolin-2(1H)-one" or "2-quinolone" should be used.

2) In the experimental section, both weights and mol are necessary, and some these numbers are lacked.

3) It is necessary to indicate the form of crystals such as "colorless needles", and " pale yellow plates".

4) In the ¹H NMR, the chemical shift for triplets and quartets should not be shown with the range.

Coupling constants should be given with one more decimal.
