### Compulsory REVISION comments

- **Porter’s Diamond model is Porter’s five forces? What is the difference of between Porter’s Diamond model generic strategies, five forces?**
  - 126 and value chain (George, 2007).
  - Change the name Background to INTRODUCTION. And recount the all the section numbers, taking off the .0.
  - Section introduction has to be on page 2.
  - The motivation for testing the Porter’s model depends only by the authors, please justify the phrase according Tanzania’s industries.
  - Line 57 to 68 – rewrite.
  - Put in the conclusion: a study that to the best of our knowledge has never been hitherto carried out in Tanzania.
  - Explain better: 200 questionnaires were distributed to the targeted population, but the authors collected 155. Your sample is 155 not 200. “The data were collected from questionnaires which were administered through 155 respondents. The questionnaires were distributed and collected from 155 respondents”

Correct the citation: Bala, 2011 and Prunea, 2014

ICT - describe

ANOVA Statistics of the variables, and the model fit indices for both 250 measurement and structural model? The authors should be more clear about the testing of hypothesis. Correct the sample and recalculate all statistics values.

Put the questionnaire used in this study in the methodology section.

Variance level is too big, it is right?

How the authors get the linear equation model, how and why those dependent variables were chosen?

In the conclusion section the authors said: This study has examined the applicability of PDM in textile and apparel industries in Tanzania, using data from firms located in Dar es Salaam. But in the abstract they said that the data were collected three regions namely, Dar es salaam, Arusha and Mwanza?

Table 4, the ANOVA test consist with 5 df – between and 149 df- inside of your sample, you consider alpha (α) = 5%, we get the fc=4,365 and you f value was 14.234. when f-sample > fc (α), we do not considered the null hypothesis. The authors must do this analysis to each five null hypotheses at the ANOVA Statistics test. It is the main contribution of this work.

The null hypotheses for this purpose states that factor analysis cannot be used to analyze
